

IN THE SPECIFICATION:

Please replace paragraph 31 with the following paragraph:

There is an air-bearing surface (not shown) for floating the second supporting frame 33 under a bottom surface of the ~~second~~ first supporting frame ~~33~~34. The air-bearing surface keeps the optical pickup head floated by a fluid dynamic air buoyancy for maintaining a near field gap from a surface of the optical disk, when minimizing weight of the optical head floated by the air-bearing surface is an important parameter in adjustment of the near field gap. Therefore, in the present invention, it is very important to minimize a size of the micro mirror integrated to the optical pickup.
